

BPMT ThinkTank: CEP with BPMS for Agility

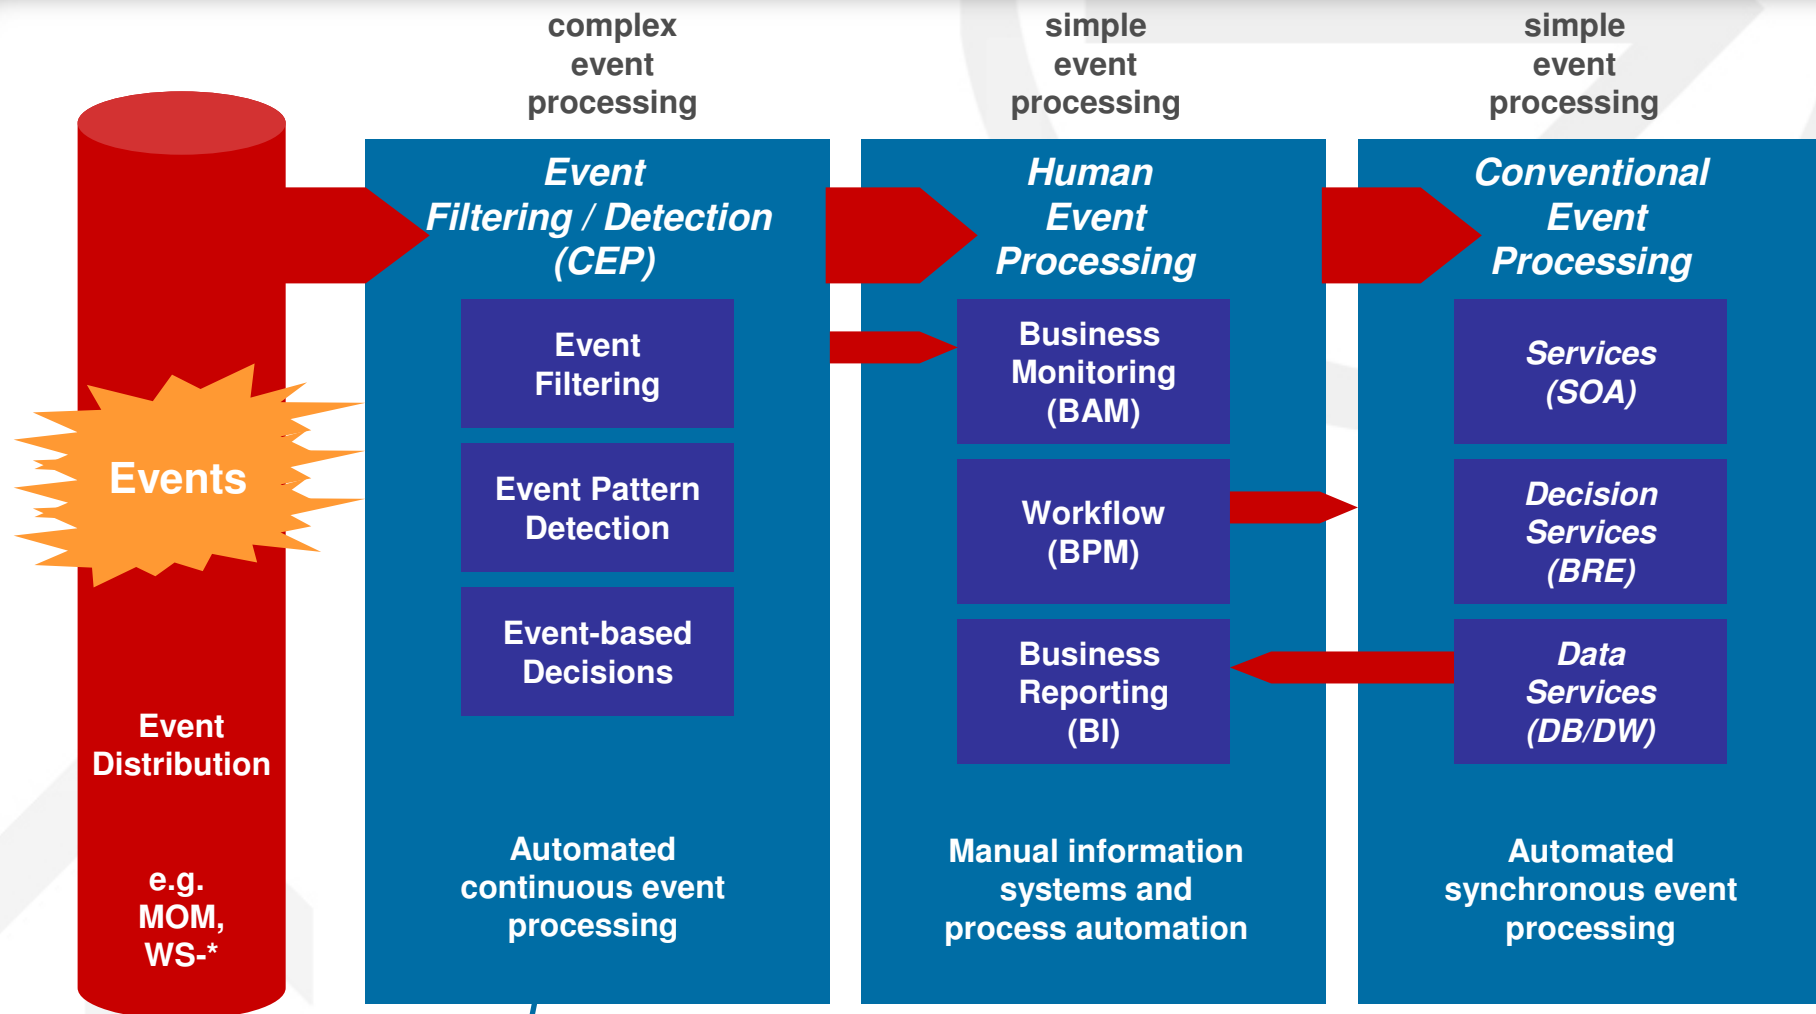

Enterprise view of Event Processing

Intro: CEP Role in Processes

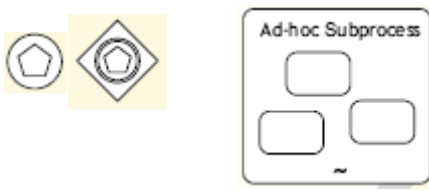

Intro: Event Processing Components

Includes
Event Stream Processing

Intro: CEP Role in Detailed Processes

Many process-driving events are in reality abstract events

CEP can handle these based on collections, time, etc

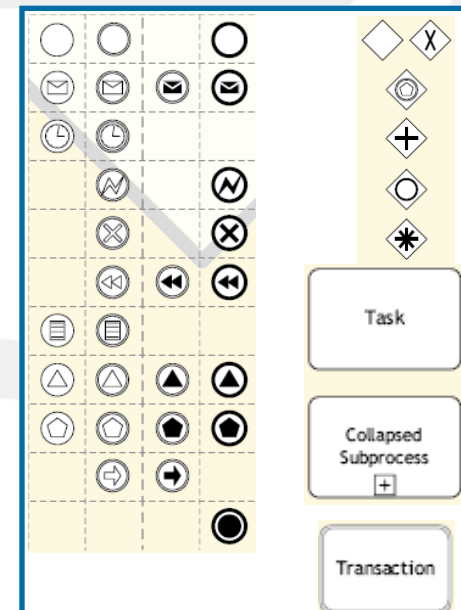

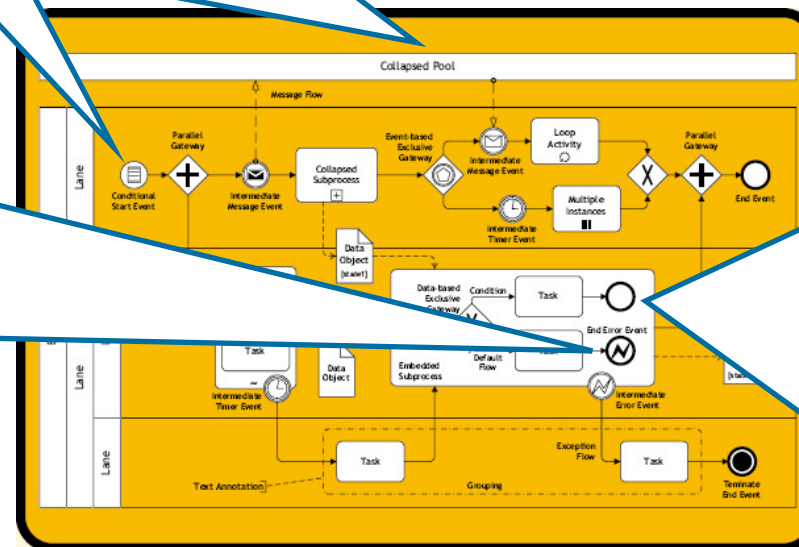

Many process diagrams cannot easily handle complexities such as case-management, cross-process inference rules, etc

CEP can usefully “drive” BPM

Many exceptions are “cross process” and based on patterns of multiple events

CEP can monitor process exception events across processes / process instances

Monitoring process events for business monitoring is essential for process improvement

CEP can monitor process runtime events across processes / process instances

Roundtable Issues & Resolutions

- 1. Need to monitor / measure processes + performance, across different process levels and vendors**

→ CEP can provide real-time BAM / reporting / oversight / control capabilities for BPM (+ SOA)

- To support necessary Prevention, Detection, Correction

- 2. Enterprise Architecture view needs to view events, processes as more abstract than BPMN and Event Patterns**

→ CEP modeling not yet mature / standardized [see PRR et al]

- 3. How does CEP add “agility” to BPM?**

→ Event-driven rules across / driving Processes / Process instances
+ Real-Time decisions close to event occurrence / detection

Roundtable Issues & Resolutions

4. CEP may be overkill for some processes

→ Indeed CEP is currently not part of any COTS BPMS
(although some vendors provide CEP + BPM usable together)

5. Operational Intelligence overlaps with “Knowledge Management”

→ Future convergence?
