1-minute training course: How Inferencing works

- **A rule's action can be another rule's condition**
  - Customer, Transaction
    If Customer.id = Transaction.cid and Customer.status = "Gold client"
    Then Transaction.priority = high

  - Transaction
    If Transaction.priority = high
    Then Transaction.shipmentDate = date(today)

- **At runtime, executions of one rule can cause other rules to become "valid"**
  - E.g. 4 transactions => 2 transactions are high priority
    and in the next rule execution
    2 transactions high priority => 2 transactions shipment date set to today

- **Multiple "chains" of such inferences may be executed per rule engine "run"**
